## IP-JP4-CL-10 JP4 Series Centralized Controller

### SINGLE INTERFACE CONFIG

The central brain for JP4 AVoIP systems. The controller is the single point for auto-discovery of upto 192 end-points making large installs a breeze. But that's not all. The CL can send mass updates including end point (TX or RX) settings and firmware updates at a single button press. The CL combined with Netvio's configuration software makes it the fastest solution to install.

### DUAL ETHERNET

The Dual Ethernet ports fulfil a essential role. Firstly the one port supports PoE for convenient power. With dual network ports you can separate AVoIP end-point devices from your standard network where your control system and wireless routers live. Overall dual ports simplifies the whole process.

### SECURITY

The JP4 series is protected by a suite of encryption technologies that ensure the security and integrity between components. It features both internal browser sessions, which are encrypted with SSL (secure socket layer) protocol version 3 & TLS 1.2 protocols; as well as external connections using custom certificates to authenticate users

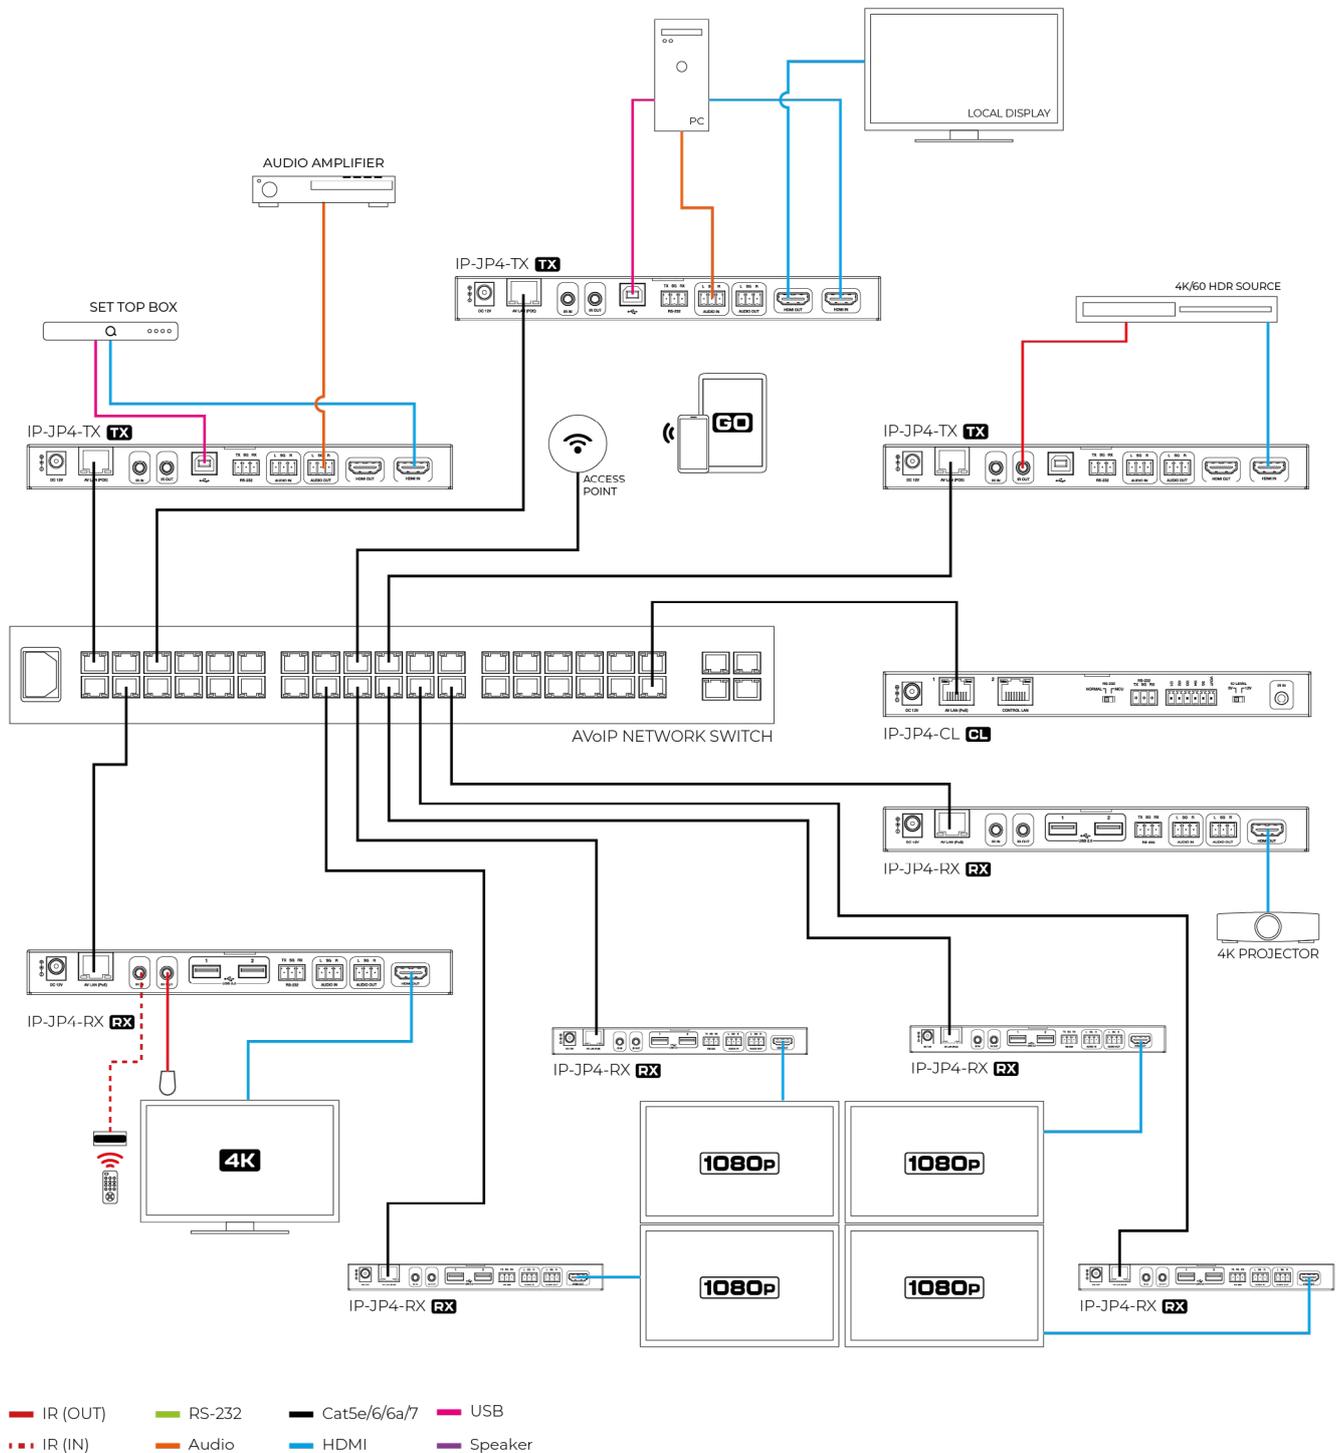

### EASY VIDEO WALL CONFIG

16x16 video wall support including landscape and portrait modes with bezel adjustments. Best software interface for easy set-up. End-to-End solution completed with client side user control with ultra high quality real-time preview streaming.
